Examen microscopique

24h culture

48h identification/antibiogramme

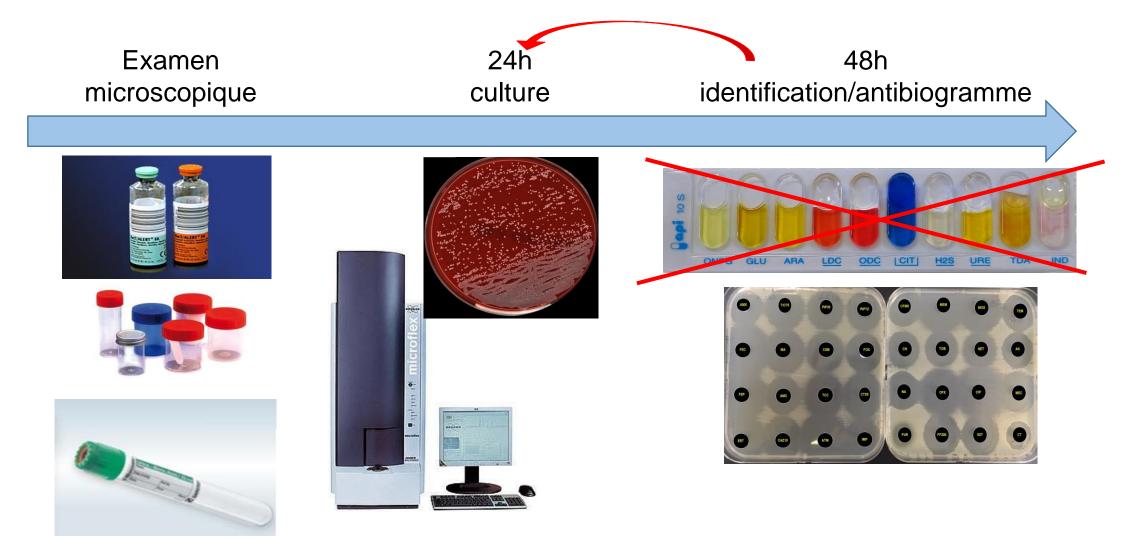

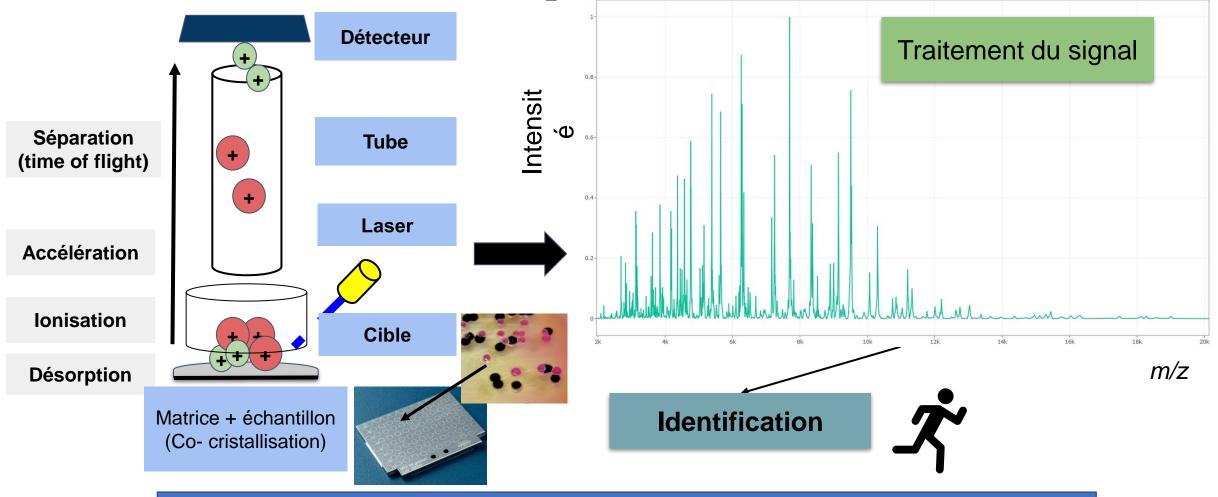

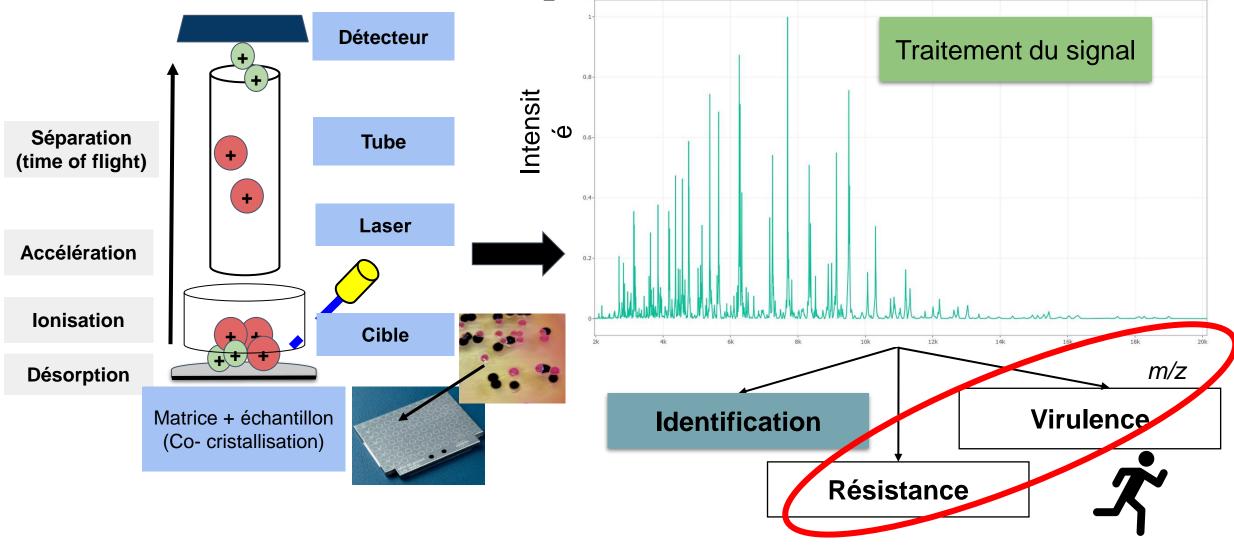

Matrix Assisted Laser Desorption Ionization Time Of Flight

Quelques minutes *versus* quelques heures (méthodes biochimiques, moléculaires ...)

Objectif : améliorer les performances du MALDI-TOF SM à l'aide des techniques de Machine Learning Développement d'outils bio-informatiques facilement utilisables pour la communauté scientifique et la routine

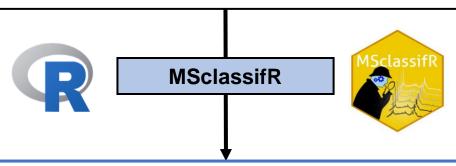

Objectif : améliorer les performances du MALDI-TOF SM à l'aide des techniques de Machine Learning Développement d'outils bio-informatiques facilement utilisables pour la communauté scientifique et la routine

B

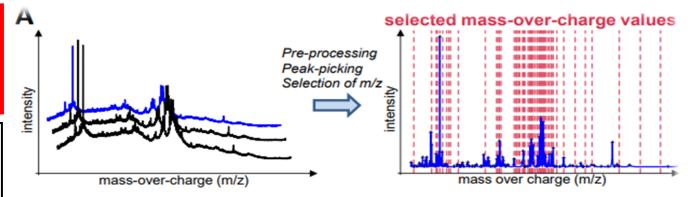

- Nouvelles bases de données
- Nouveaux algorithmes :
- → Machine Learning, MSI

Problématique des techniques d'IA et biologiste :

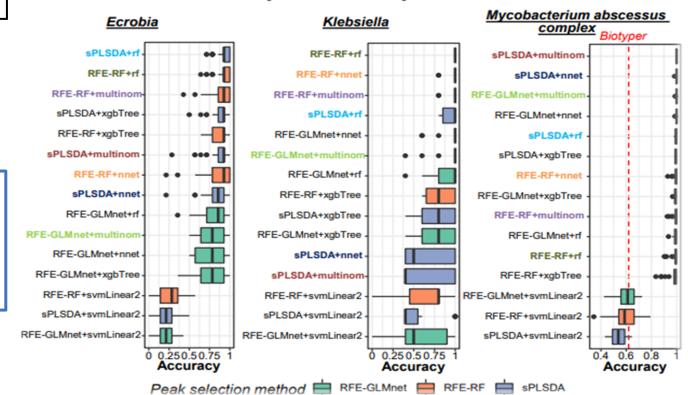

- programmation : challenge, quelles méthodes ?
- solution « tout en un » : payant, l'utilisateur n'a pas la main et non exhaustivité des méthodes

- Package R open-source, des pipelines d'analyse complets, faciles à utiliser
- 15 pipelines d'analyse avec des techniques de Machine Learning
- Illustré par deux exemples disponibles sur le CRAN

Comparison of ML-methods to estimate a classification model ranked by mean accuracy on test datasets

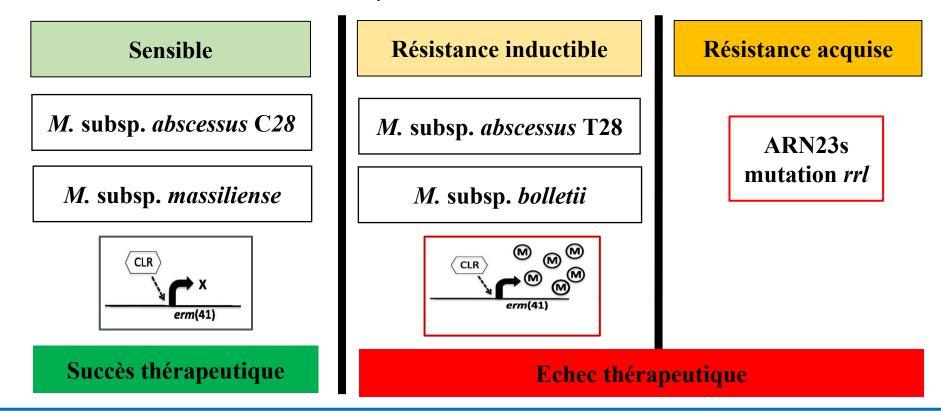

Exemple 1 : Mycobacterium abscessus

Journal of Antimicrobial Chemotherapy

Mycobacterium abscessus: a new antibiotic nightmare

M. abscessus (3 sous-espèces): abscessus, bolletii, massiliense

Clarithromycine : traitement de référence

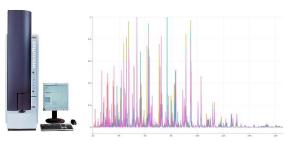

Identification rapide = adaptation précoce du traitement

Exemple 1 : Mycobacterium abscessus

scientific reports

Context (1): Mucormycosis infection

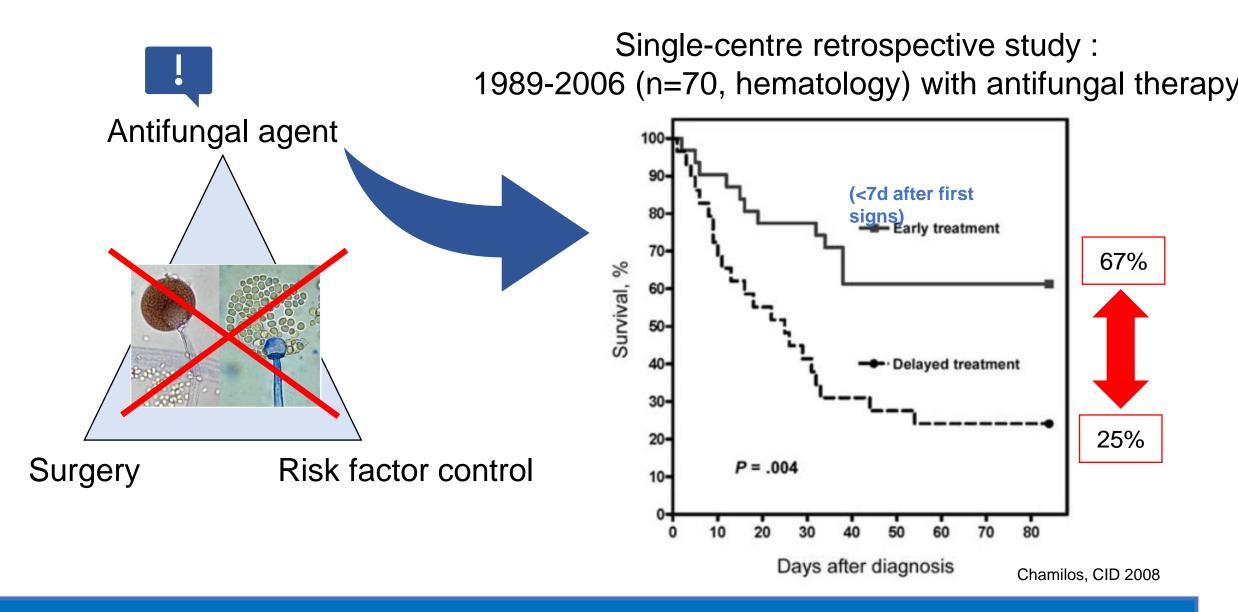

Mucormycosis infections = opportunistic fungal infection

- → filamentous fungi (family of Zygomycetes, order of Mucorales)
- → ~27 species under Mucorales are associated with human infections (*Rhizopus, Mucor, Absidia, Rhizomucor*)
- → multiples localisations: lung, brain, disseminated, skin
- → risk factors :diabetes, haematological malignancy, solid organ transplant, burn (immunodépression +++)
- → prevalence: 400 in 2020

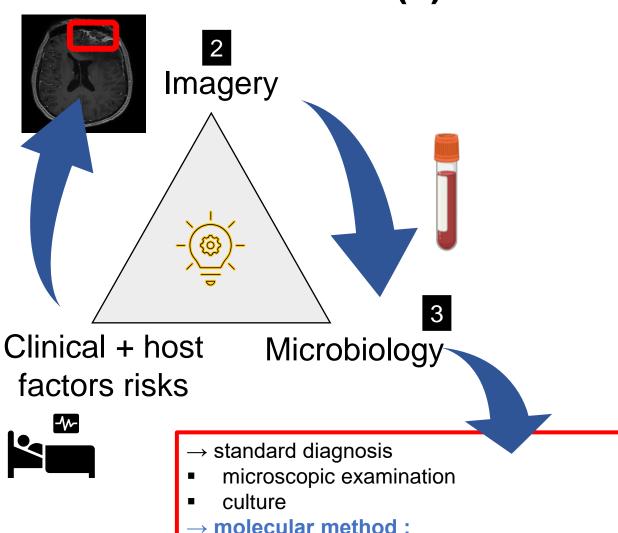

(Cornely OA *et al.*, 2019, the Lancet) (Lherm M et al., 2020)

Context (2): Mucormycosis infection

Mucormycosis = therapeutic urgency

Context (3): Mucormycosis infection

qPCR: positive 9 days before culture

Revision and Update of the Consensus Definitions of Invasive Fungal Disease From the European Organization for Research and Treatment of Cancer and the Mycoses Study Group Education and Research Consortium

Study Group Education and Research Consortium Recent history of neutropenia (<0.5 × 10⁹ neutrophils/L I<500 neutrophils/ mm³] for >10 days) temporally related to the onset of invasive fungal Hematologic malignancy^a Receipt of an allogeneic stem cell transplant Receipt of a solid organ transplant Prolonged use of corticosteroids (excluding among patients with allergic Mycological evidence bronchopulmonary aspergillosis) at a therapeutic dose of ≥0.3 mg/kg Any mold, for example, Aspergillus, Fusarium, Scedosporium species or ticosteroids for ≥3 weeks in the past 60 days Mucorales recovered by culture from sputum, BAL, bronchial brush, or Treatment with other recognized T-cell immunosuppressants, such as calcineurin inhibitors, tumor necrosis factor-a blockers, lymphocyte-Microscopical detection of fungal elements in sputum, BAL, bronchial specific monoclonal antibodies, immunosuppressive nucleoside analogous control and control brush, or aspirate indicating a mold Treatment with recognized B-cell immunosuppressants, such as Bruto Tracheobronchitis tyrosine kinase inhibitors, eg, ibrutinib Aspergillus recovered by culture of BAL or bronchial brush Inherited severe immunodeficiency (such as chronic granulomatous d Microscopic detection of fungal elements in BAL or bronchial brush sease, STAT 3 deficiency, or severe combined immunodeficiency) Acute graft-versus-host disease grade III or IV involving the gut, lungs Sino-nasal diseases liver that is refractory to first-line treatment with steroids Mold recovered by culture of sinus aspirate samples Microscopic detection of fungal elements in sinus aspirate samples Pulmonary aspergillosis indicating a mold The presence of 1 of the following 4 patterns on CT Aspergillosis only Dense, well-circumscribed lesions(s) with or without a halo sign Galactomannan antigen Air crescent sign Antigen detected in plasma, serum, BAL, or CSF Any 1 of the following: Wedge-shaped and segmental or lobar consolidation Single serum or plasma: ≥1.0 Other pulmonary mold diseases BAL fluid: ≥1.0 As for pulmonary aspergillosis but also including a reverse halo sign Single serum or plasma: ≥0.7 and BAL fluid ≥0.8 Tracheobronchial ulceration, nodule, pseudomembrane, plaque, or escha CSF: ≥1.0 seen on bronchoscopic analysis Aspergillus PCR Any 1 of the following: Acute localized pain (including pain radiating to the eye) Plasma, serum, or whole blood 2 or more consecutive PCR tests positive Nasal ulcer with black eschar BAL fluid 2 or more duplicate PCR tests positive Extension from the paranasal sinus across bony barriers, including into At least 1 PCR test positive in plasma, serum, or whole blood and 1 PCR

test positive in BAL fluid

Aspergillus species recovered by culture from sputum, BAL, bronchial brush

qPCR = contributory element for a rapid complicated diagnosis +++

Central nervous system infection

Meningeal enhancement on magnetic resonance imaging or CT

of the following 2 signs: Focal lesions on imaging

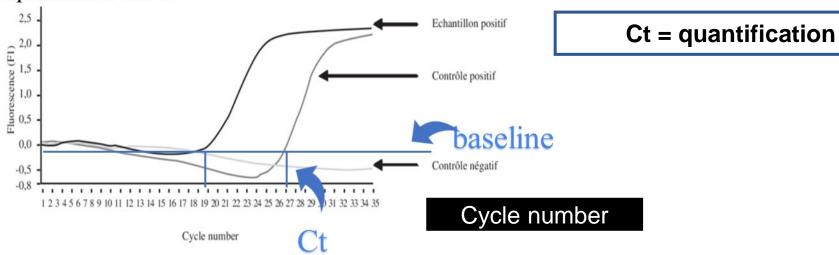

Quantitative PCR = Real-time PCR = qPCR

- → use of fluorescent probes that bind to double-stranded DNA (SYBER technology)
- → allows monitoring of the amount of DNA produced in the reaction medium (≠ end-point PCR)

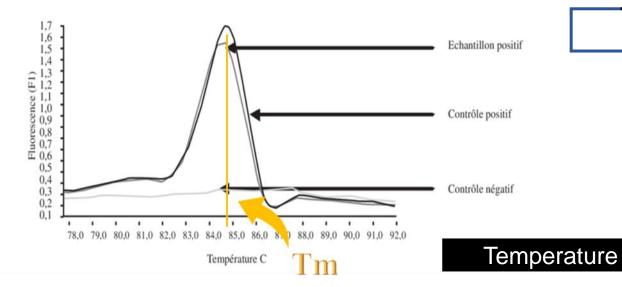

http://www.geocities.ws/jsonnentag/iguana/pcr.htm

Measures the number of amplicons: portion of DNA defined by a pair of primers

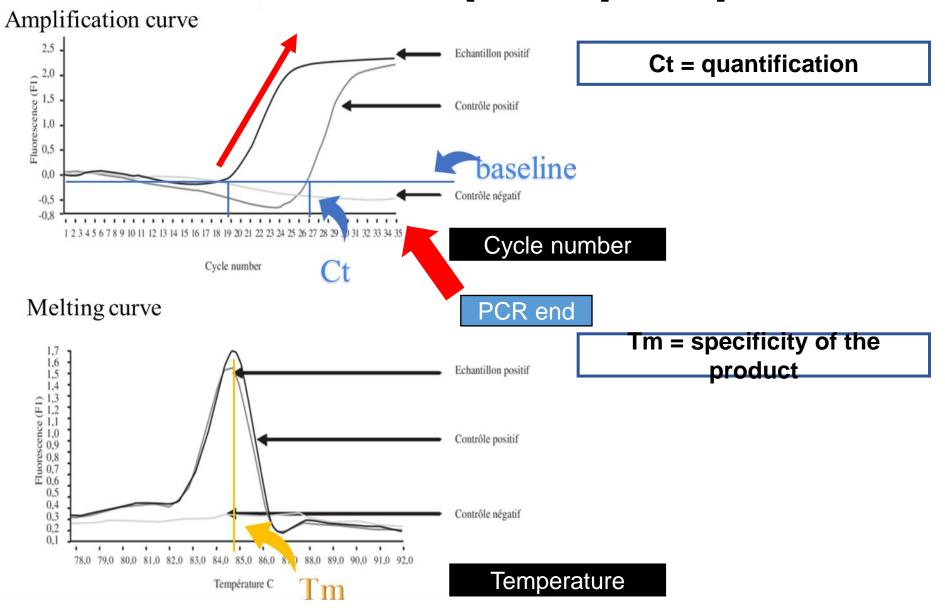

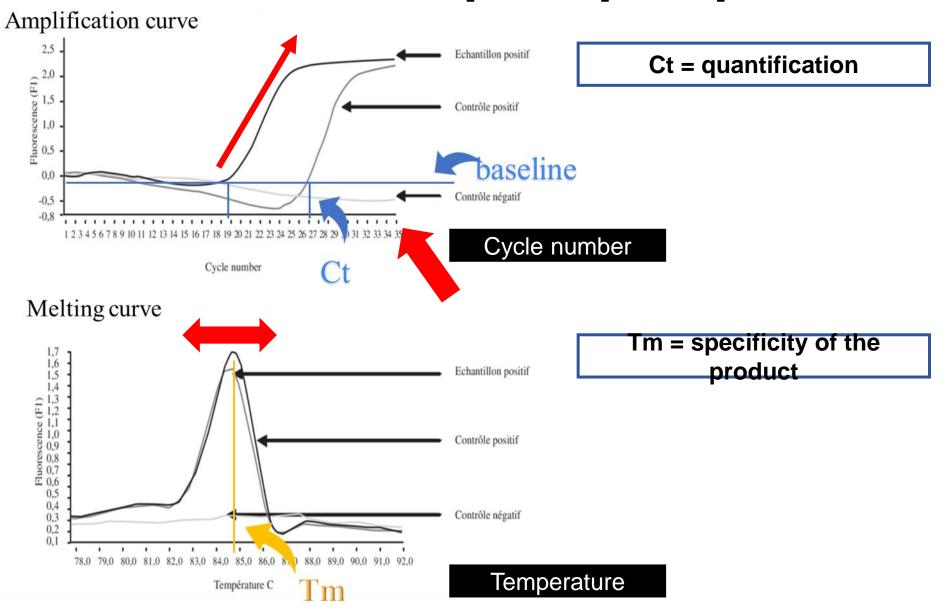

Melting curve

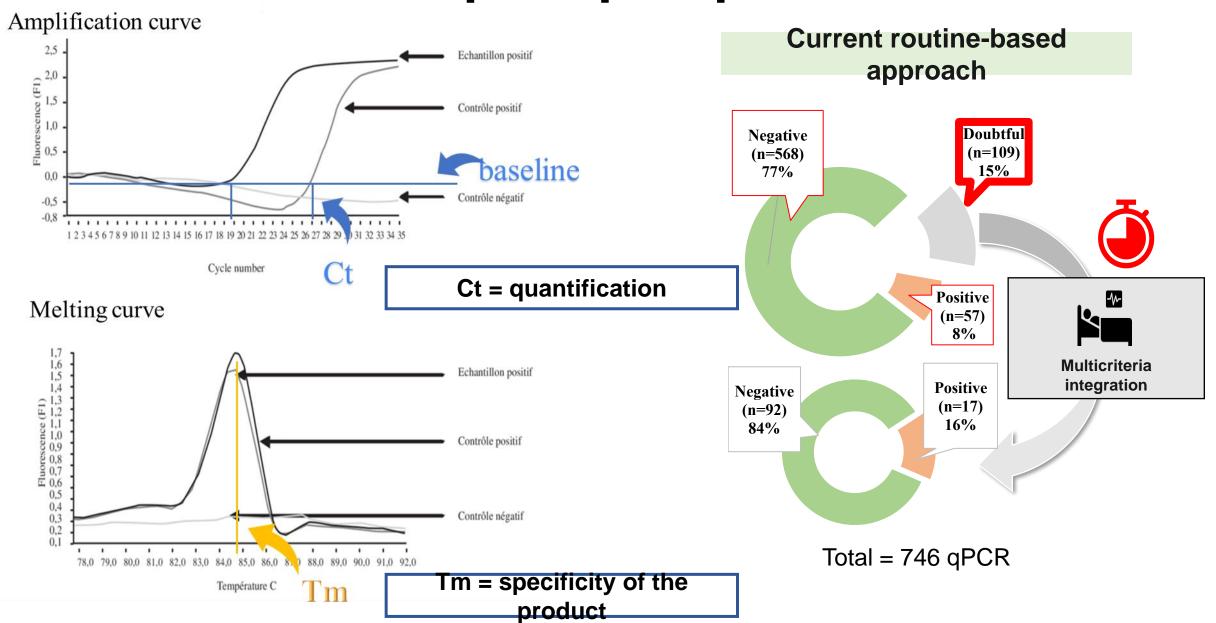

Tm = specificity of the product

Ilhem, Mihoubi & de monbrison, Frederique & Romeuf, N & Moulahem, T & Picot, Stephane, (2006). Outsourced real-time PCR diagnosis of cutaneous leishmaniasis in the outbreak region of Constatine, Algeria. Médecine tropicale : revue du Corps de santé colonial. 66. 39-44.

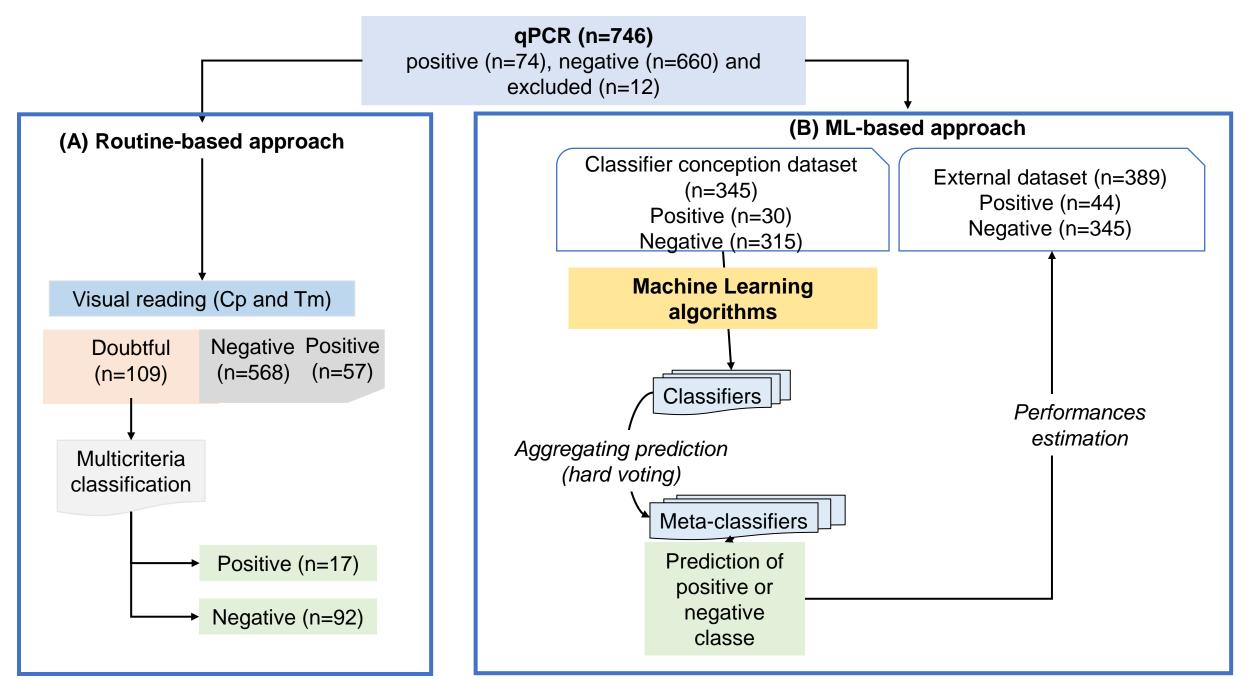

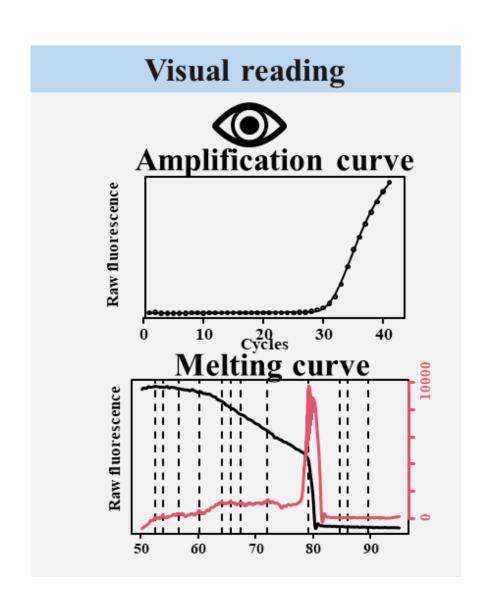

Objective

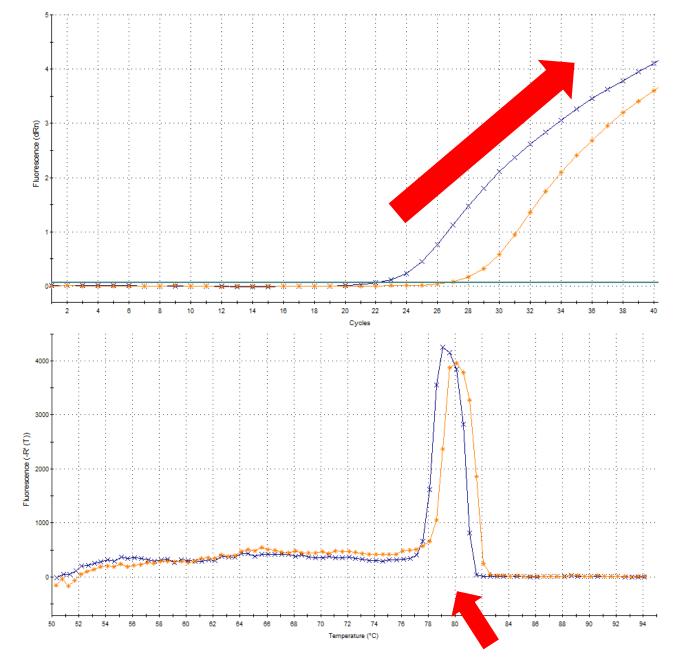

Evaluate the contribution of implementing a ML-based classification approach to the interpretation of the plots (amplification and melting curves) by comparing the performances of the "visual reading" and ML into qPCR results interpretation

Methods

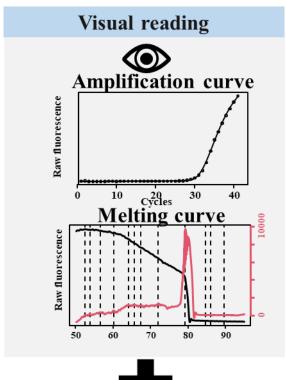

Methods: (A) routine based approach

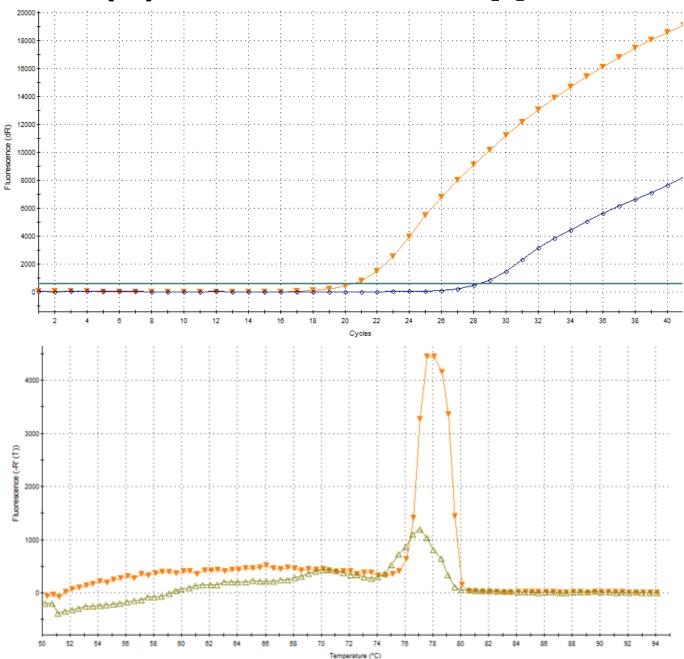

Methods: (A) routine based approach

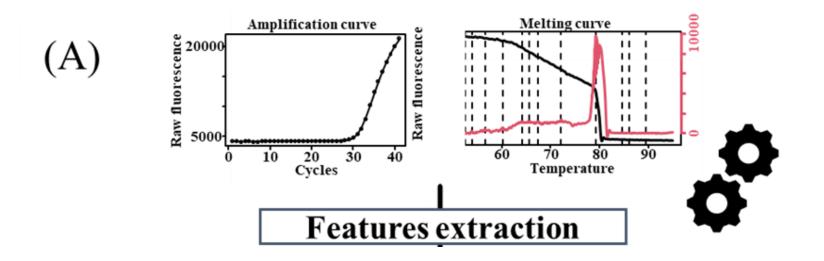

Methods: application to qPCR mucor (B) ML-based approach

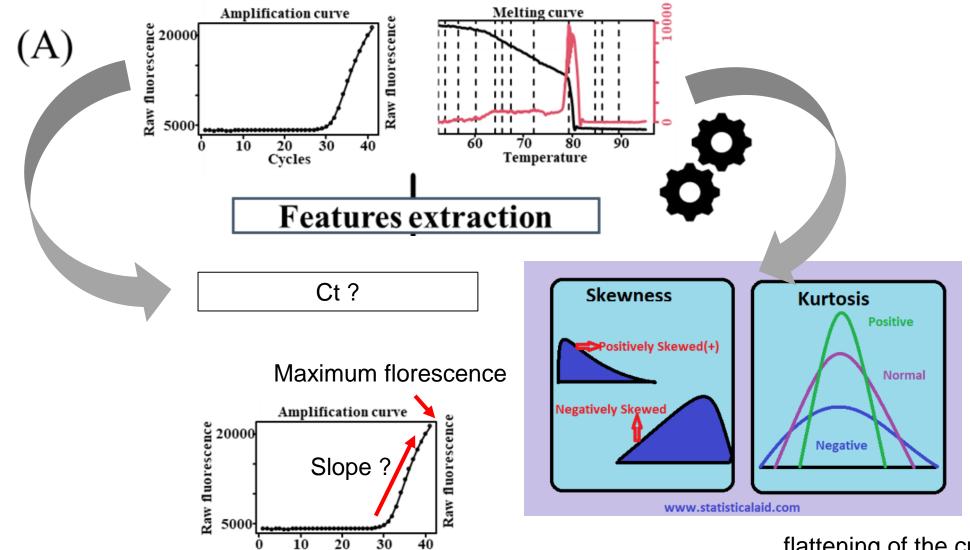

First question: how to transform these curves into informative numerical values?

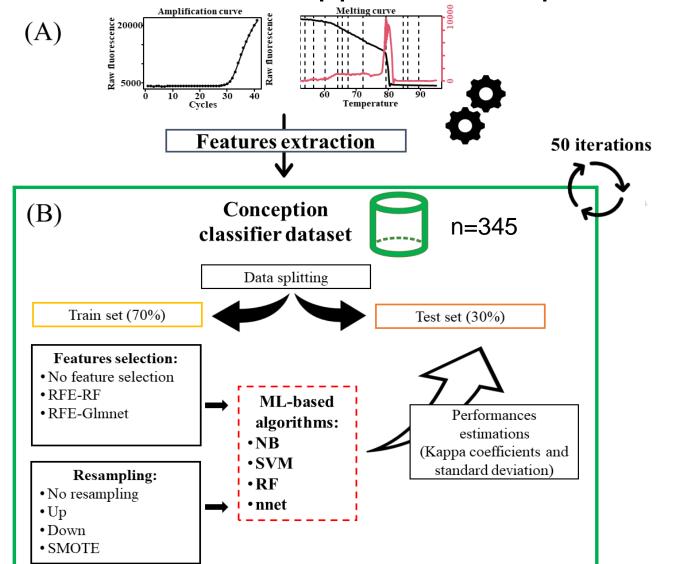

Methods: application to qPCR mucor (B) ML-based approach

First question: how to transform these curves into informative numerical values?

Cycles

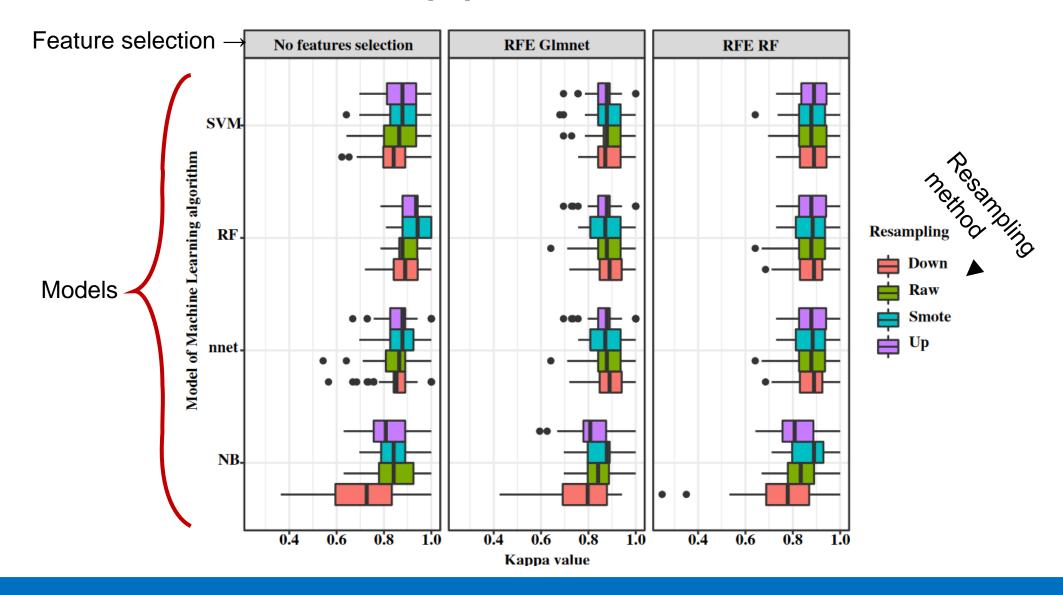

Methods: application to qPCR mucor (B) ML-based approach

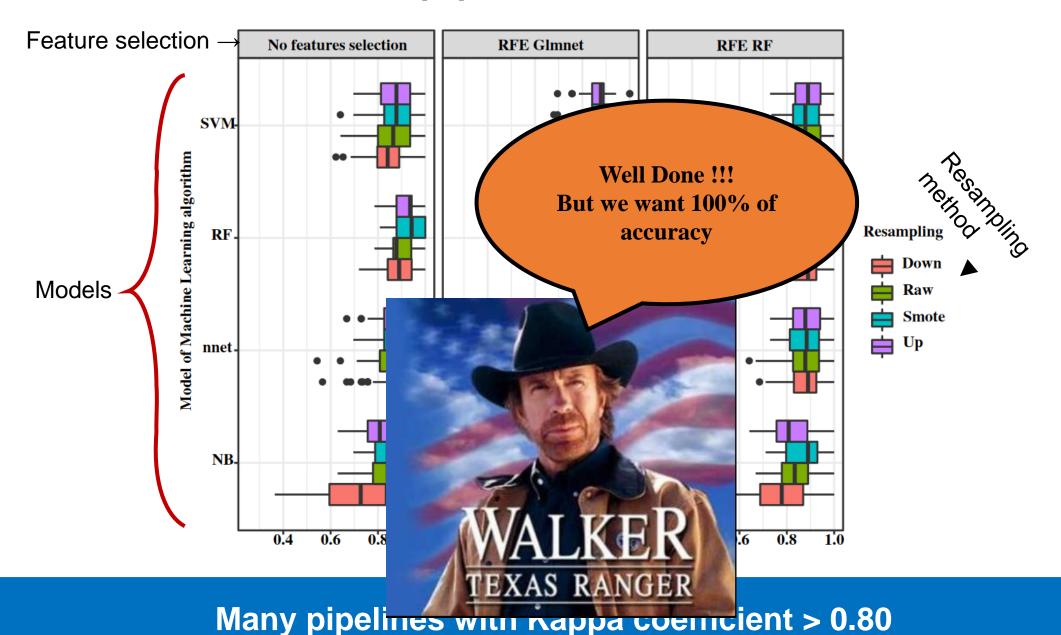

- Feature selection (3 ML algortihms):
- → determining which features are informative
- Resampling method (3 methods)
- → positive events are rare = difficulty of a model to recognize its events because trained on the majority (negative) class
- ML based algotihms (4 algorithms)
- 50 iterations : check that the results are not random

Comprehensive analysis pipeline that considers class imbalance robustness checks of the results

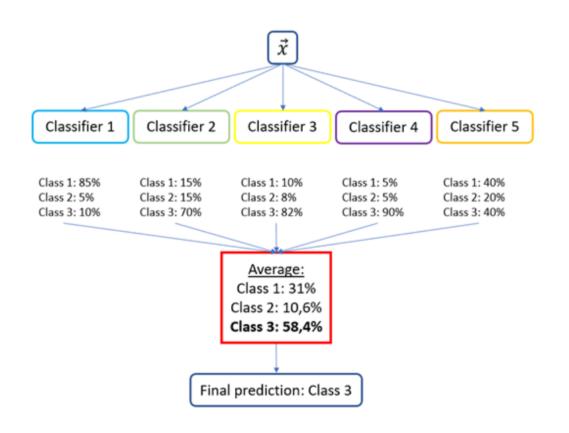

Results: (B) ML-based approach

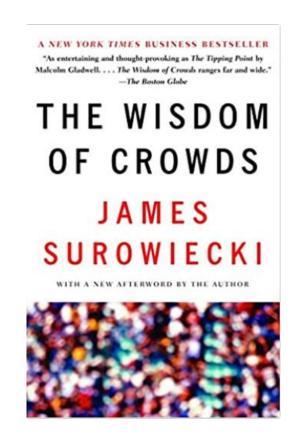

Results: (B) ML-based approach

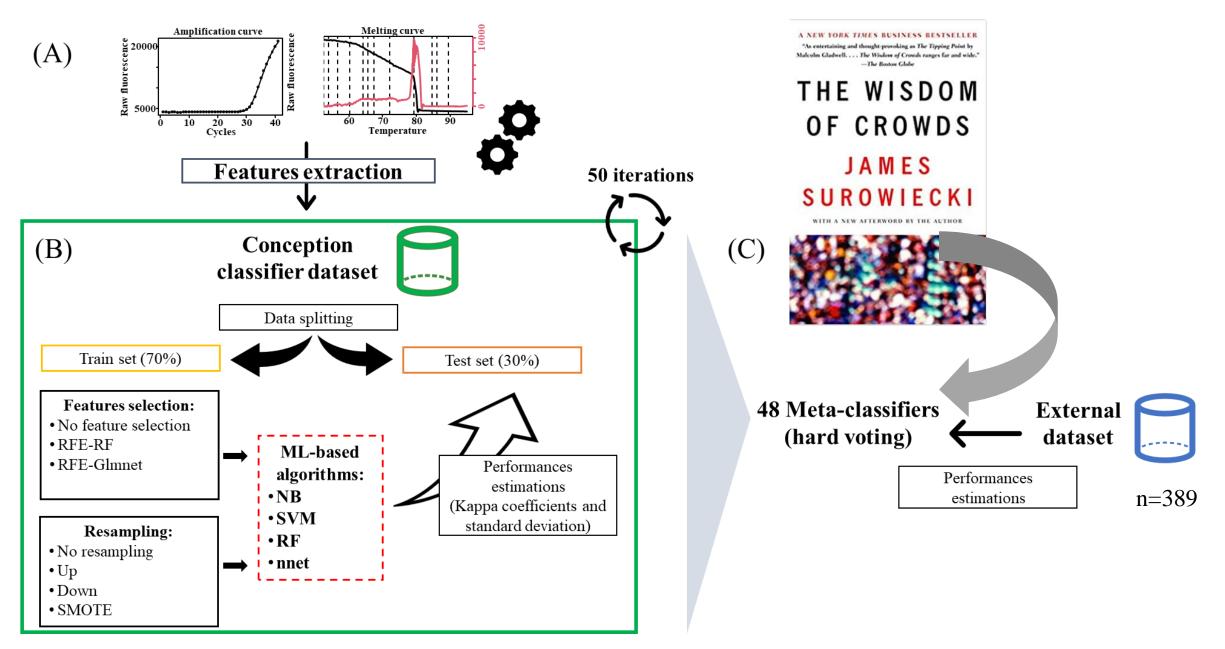

Example: (B) ML-based approach

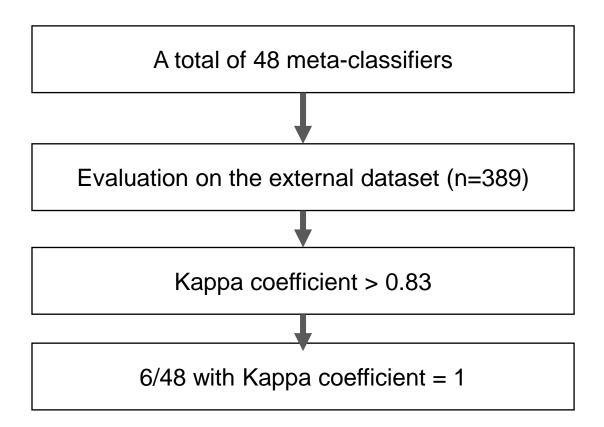

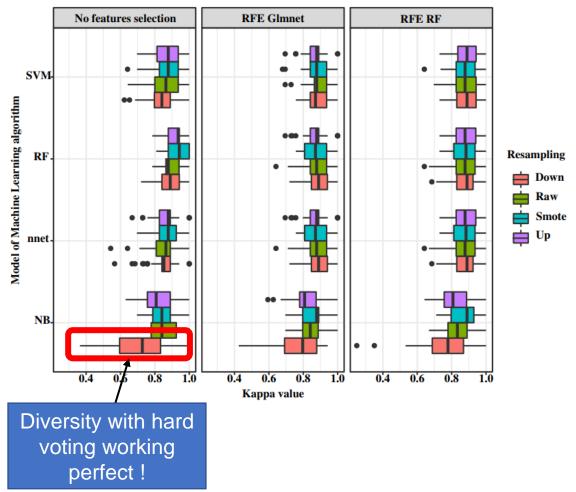

Wisdom of crowds:
a crowd of independent people with differing opinions is more accurate than the opinion of a single expert!

Methods: (B) ML-based approach

Results: (B) ML-based approach

Diversity of the meta-classifiers 6/48 total agreement on the external dataset

Conclusion

- ML approach enables to reliably and rapidly classify qPCR without the need of clinical, microbiological and radiological data
- time savings +++
- avaible online: http://gepamy-sat.asso.st/
- evaluation of the method on another qPCR

qPCR Mucormycosis using Machine Learning

Application to mucormycosis diagnosis for research use only

- . The partial or complete reproduction or use of the codes of this application is not authorized without agreement

2. Uses of the application

Notice Results Contact

Intercalating-Dye-based quantitative PCR (IDqPCR) is an important diagnostic tool for infections in routine laboratories. However, the interpretation of the results based on a visual analysis of the amplification and melting curves may sometimes be tricky due to non-specific fluorescence. This application has been develoged to help the interpretation of IDqPCR results for the diagnosis of Mucormycosis using Machine Learning algorithms. A total of 8 meta-classifiers each composed of the aggregated predictions of 50 classifiers using the hard voting method (picking the prediction with the highest number of votes) are available to classify the IDqPCR results into positive and negative. The performance of these meta-classifiers was estimated on a test set of 401 IDqPCRs with an accuracy of 1.

- step 1: load your data in a .xls file (a copy of the raw file is available at this link)
- step 2: fill in the form with the date
- step 3: choose your meta-classifier
- step 4: click-on Machine Learning analysis

After a short analysis time the results are available in the Results tab (second tab).

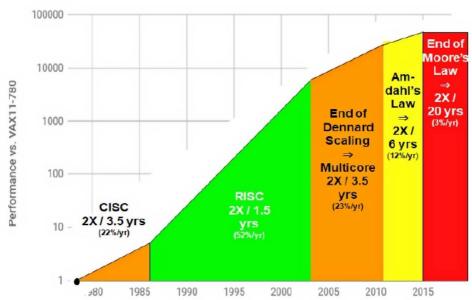

The application returns an array composed of 5 columns:

- . id corresponds to the identification of the well in the form: year_month_day_wellnumber
- Positive corresponds to the number of models (classifiers) that estimated that the results were positive
 Negative corresponds to the number of models (classifiers) that estimated that the results were negative
- . Max vote returns the final result of the meta-classifier with the maximum number of votes (be careful in case of a tie, the result is returned negative
- Well indicates the location of the sample on a 96 well plate.

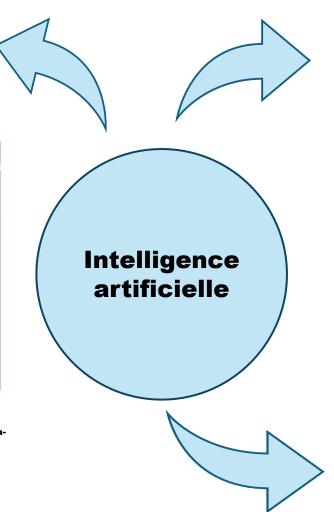

Conclusions, perspectives
